

Our solar system: the giant planets and their moons

First: finish terrestrial planets

terrestrial planets: small rocky worlds with thin atmospheres

giant planets: four huge gas giants, containing most of the mass of the Solar System

many very small ice/rock balls

LLM policy for homework 4, project

- Use LLMs (like ChatGPT) however you would like!
 - Acknowledge where you use it!
 - (obviously that acknowledgement is specific to this class; follow the syllabus for other courses and be smart about using ChatGPT – it can be obvious)
- The work you turn in must be your own
 - Points may be deducted when answers sound too much like ChatGPT.
- I think that LLMs won't help too much with the project
 - Editing/structure help
- Homework 4: added a hard question because students did so well previously
 - ChatGPT effect!

Mercury
Venus
Earth
Mars

Jupiter

Saturn

Uranus

Neptune

Pluto and Charon
Eris

All the planets (but not Pluto) orbit in the same direction and in the same plane: the *ecliptic* (to within 6°).

The terrestrial planets

– *rocky worlds*

The moon and Mercury

Properties of Earth, Venus, and Mars

Property	Earth	Venus	Mars
Semimajor axis (AU)	1.00	0.72	1.52
Period (year)	1.00	0.61	1.88
Mass (Earth = 1)	1.00	0.82	0.11
Diameter (km)	12,756	12,102	6,790
Density (g/cm ³)	5.5	5.3	3.9
Surface gravity (Earth = 1)	1.00	0.91	0.38
Escape velocity (km/s)	11.2	10.4	5.0
Rotation period (hours or days)	23.9 h	243 d	24.6 h
Surface area (Earth = 1)	1.00	0.90	0.28
Atmospheric pressure (bar)	1.00	90	0.007

Venus

Thick atmosphere

Venus

Only a few landers
(all Soviet Union)

Venus has hardly any impact craters; the surface density of craters indicates most of the surface is only 600 million years old; but craters do not appear to be eroding. Where are all the older craters?

Perhaps Venus undergoes periodic *catastrophic resurfacing*. The last such event would have taken place about 600 million years ago.

The volcano Sif Mons. is about 2 km high and nearly 300 km across. There appear to be recent lava flows at the front of the image: these flows are about 120 km long, which suggests that these lavas were also very fluid.

Atmospheric Composition of Earth, Venus, and Mars

Gas	Earth	Venus	Mars
Carbon dioxide (CO ₂)	0.03%	96%	95.3%
Nitrogen (N ₂)	78.1%	3.5%	2.7%
Argon (Ar)	0.93%	0.006%	1.6%
Oxygen (O ₂)	21.0%	0.003%	0.15%
Neon (Ne)	0.002%	0.001%	0.0003%

 Earth

Basic Properties of the Jovian Planets

Planet	Distance (AU)	Period (years)	Diameter (km)	Mass (Earth = 1)	Density (g/cm ³)	Rotation (hours)
Jupiter	5.2	11.9	142,800	318	1.3	9.9
Saturn	9.5	29.5	120,540	95	0.7	10.7
Uranus	19.2	84.1	51,200	14	1.3	17.2
Neptune	30.0	164.8	49,500	17	1.6	16.1

Ice giants are much smaller: started with similar sized core, but could not accrete enough material

Earth

Gas giants

Jupiter, Saturn
Much more massive
Abundances similar
to sun

Ice Giants

Uranus, Neptune
Much less massive
Similar cores as gas
giants

Gas giants

Jupiter: energy from contraction (2 cm/yr)

Saturn: energy from differentiation (heavier elements sink)

Ice Giants

Cold
